

## Current Knowledge is POWER

Simson Maxwell recognizes that the power generation industry is ever evolving and therefore the need for current training on equipment related to our industry is critical to ensure proper diagnostics process and service capability.

Simson Maxwell has developed a robust training program that can also be tailored to meet the needs of other organizations involved in our industry involving both general and specialized service training courses.

## Simson Maxwell POWER School

Through our certified Technical Trainer, Simson Maxwell can provide comprehensive technician service training on all engine and system related technology. All courses are conducted according to a predetermined curriculum and schedule.

Comprehensive textbooks and manuals are provided to supplement lectures by our job-experienced and factory trained instructor.

Lectures on theory and operation are conducted in the classroom for easy reference and better retention. Following the theoretical session of the course, hands-on work experience is incorporated into all courses to provide the technician with maximum in-depth training.

Service training course content has been carefully selected to ensure technicians receive adequate instruction on theory of operation, maintenance, repair, overhaul and troubleshooting. Procedures specific to each engine brand and model are explained in theory, followed by training in the workshop on actual components with demonstrations of proper assembly and operation procedures.

## Training POWER Onsite

Our program can be tailored to smaller settings to provide more dedicated, one on one training with a greater focus on troubleshooting as well as in larger settings to multiple technicians at a time utilizing a combination of classroom and hands on practical training.

The flexibility of our program and training format allows for our trainer to travel to your venues to allow training be directly related to equipment that your technicians diagnose and repair on a daily basis or for us to offer the training out of our centralized training facilities.

Contact our Power School to have our representatives arrange a time to visit your location to review the training needs of your specific organization.

Should you be interested in further information related to our training offerings, please contact us at [training@simmax.com](mailto:training@simmax.com) or Jackie Gordon (Dir. HR and Training) at 403 259 7312.

## New or Existing Power Systems Extended Operator / Maintenance

Our Factory trained instructor can offer detailed operator / maintenance on new equipment to your job sites and locations.

A combination of classroom and hands on instruction can provide your on-site personnel a comprehensive understanding of your onsite power system to ensure your team are well equipped for the day to day maintenance and operation requirements of your equipment.

Familiarization with all aspects of your equipment, allows your onsite professionals to perform required inspections and maintenance protocol to ensure the longevity of your power systems.

Contact our POWER School today to discuss the specific needs of your new power package and what training we can arrange to facilitate for you and your team! [training@simmax.com](mailto:training@simmax.com)
